the volume contains twelve papers dealing with the approximation of first and second order problems which arise in many fields of application including optimal control image processing geometrical optics and front propagation some contributions deal with new algorithms and technical issues related to their implementation other contributions are more theoretical dealing with the convergence of approximation schemes many test problems have been examined to evaluate the performances of the algorithms the volume can attract readers involved in the numerical approximation of differential models in the above mentioned

fields of applications engineers graduate students as well as researchers in numerical analysis

after an introductory chapter concerned with the history of force free magnetic fields and the relation of such fields to hydrodynamics and astrophysics the book examines the limits imposed by the virial theorem for finite force free configurations various techniques are then used to find solutions to the field equations the fact that the field lines corresponding to these solutions have the common feature of being twisted and may be knotted motivates a discussion of field line topology and the concept of helicity the topics of field topology helicity and magnetic energy in multiply connected domains make the book of interest to a rather wide audience applications to solar prominence models type ii superconductors and force reduced magnets are also discussed the book contains many figures and a wealth of material not readily available elsewhere

this book serves as a vital resource for practitioners to learn about the latest research and methodology within the field of wireless technology covering important aspects of emerging technologies in the heterogeneous next generation network environment with a focus on wireless communications and their quality provided by publisher
